

WHAT IS CLAIMED IS:

5

1. A data transmission apparatus transmitting data received from a user terminal device through a plurality of networks to a destination, said user terminal device executing communication using an Internet protocol, said data transmission apparatus comprising:

a routing table storing information relating a destination address of the data and addresses of the plurality of networks;

15 an information table storing static and dynamic information about the plurality of networks; and

a selection unit selecting one or the plurality of networks, through which said data transmission apparatus transmits the data to the destination, based on said static and dynamic information.

20

25

2. The data transmission apparatus as claimed in claim 1, wherein said information table stores the static and dynamic information about a plurality of service classes included in a network, wherein said selection unit selects one or the plurality of service classes, through which said data transmission apparatus transmits the data to the destination, based on said static and dynamic information about the plurality of service classes.

30

9. The data transmission apparatus as claimed in claim 7, wherein said monitoring unit transmits an ICMP (Internet Control Message
35 Protocol) timestamp request message to the destination, receives an ICMP timestamp response message from the destination, and obtains

communication traffic information about the plurality of networks as the dynamic information about the plurality of networks to the destination from a timestamp of the ICMP timestamp response message.

10 10. A method of transmitting data from a user terminal device through a plurality of networks to a destination, said user terminal device executing communication using an Internet protocol, said method comprising the steps of:

15 storing information relating a destination address of the data and addresses of the plurality of networks in a routing table;

 storing static and dynamic information about the plurality of networks in an information

20 table; and

 selecting one or the plurality of networks, through which the data is transmitted to the destination, based on said static and dynamic information.

25

 11. The method as claimed in claim 10, comprising the steps of:

30 storing the static and dynamic information about a plurality of service classes included in a network, in said information table; and

 selecting one or the plurality of service

35 classes, through which the data is transmitted to the destination, based on said static and dynamic information about the plurality of service classes.

12. A transmission apparatus transmitting data received from a user terminal through a plurality of networks to a destination, said user terminal executing communication using an Internet protocol, said transmission apparatus comprising:
- means for storing information relating a destination address of the data and addresses of the plurality of networks;
 - means for storing static and dynamic information about the plurality of networks; and
 - means for selecting at least one of the plurality of networks, through which said transmission apparatus transmits the data to the destination, based on said static and dynamic information.
